**Relevant coursework** : Introduction to Artificial Intelligence and Data Science, Mathematical Methods in Engineering and Applied Science, Probability & Statistics, Optimization, Numerical Linear Algebra, Signal Processing and Advanced Control Systems, Power Electronics, Circuit Simulations, Machine Learning, Deep Learning, Geometrical Methods of Machine Learning, Models of Sequential Data, Tensor Decomposition and Tensor Networks in Artificial Intelligence.

## RESEARCH INTEREST

My current research focus is on space-time pattern mining with deep sequence to sequence models, spatiotemporal predictive modeling, dimensionality reduction, and matrix-tensor factorization, with applications to temporally evolving geo-spatial systems (weather forecast, traffic forecast, etc.).

## PROJECTS

---

### **AUTO-REGRESSIVE MATRIX AND TENSOR COMPLETION FOR SPATIOTEMPORAL IMPUTATION AND PREDICTIONS.**

Implementation of spatiotemporal constrained matrix and tensor factorization based algorithms for imputation and forecasting of weather data. Basically, autoregressive constraints on temporal dimensions and smoothness constraints on spatial dimensions were imposed during learning process.

### **TENSORIZING DYNAMIC MODEL DECOMPOSITION**

Tensor train decomposition enabled fast, efficient and stable implementation of dynamic mode decomposition in the tensor framework. This work was successfully completed under the supervision of Dr. Ivan Oseledets.

### **COMPARING INTEGER AND FRACTIONAL ORDER NN FOR TREE-SPECIES CLASSIFICATION**

The main idea was to implement fractional-order back-propagation algorithms and compare that with integer-based neural networks for multi-spectral image classification.

### **SHAPING FILTER RESPONSE WITH FRACTIONAL ORDER MODELS**

We showed fractional-order filters generalize integer order filters, allows to have more control on time and frequency responses simultaneously.

### **IMAGE SEGMENTATION WITH TOPOLOGICAL PRIORS**

We incorporated topological priors before and in the deep neural network training procedure for improving segmentation accuracy for fine-scale structures.

### **ENERGY-BASED MODELING OF DC-DC POWER CONVERTERS**

Undergraduate thesis research project under the guidance of Dr. S.A Nahvi. Development of models based on the Euler-Lagrangian framework, due to ease of energy-based (scalar) modeling rather than force-based (vector) based, was awarded an excellent mark.

### **STATE-SPACE MODELING OF POWER CONVERTERS**

The basic idea was to develop and simulate the state-space mathematical models of Power electronics converters so that we can create new ones and improve the performance of existing converters.
